FRAME CODE GENERATOR

SPECIFICATIONS

Power requirements:	AC 120 V, 50/60 Hz (NTSC) AC 220 — 240 V, 50/60 Hz (PAL)
Power consumption:	10 W (120 V) 12 W (220 — 240 V)
Dimensions:	Approx. 424(W) x 49(H) x 256(D) mm (16.7 x 1.9 x 10.1 inches)
Weight:	Approx. 3.3 kg (7.3 lb)
Video in:	BNC, 1.0 Vp-p (75 ohms on/off selectable)
Video out 1:	BNC, 1.0 Vp-p (at 75 ohm load)
Video out 2:	BNC, 1.0 Vp-p (at 75 ohm load)
Audio in:	XLR, +4 dBs phono, -5 dBs
Audio out:	XLR, +4 dBs phono, -5 dBs
External pulse in:	BNC, TTL level
Supplied accessories:	Rack mount brackets Operation manual AC cord

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY SHADING AND MARK  ON THE SCHEMATIC DIAGRAMS AND IN THE PARTS LIST ARE CRITICAL TO SAFE OPERATION. REPLACE THESE COMPONENTS WITH SONY PARTS WHOSE PART NUMBERS APPEAR AS SHOWN IN THIS MANUAL OR IN SUPPLEMENTS PUBLISHED BY SONY.

CHAPTER 1

GENERAL

1-1. GENERAL

The Sony FCG-700 frame code generator sequentially numbers each picture frame recorded on a tape. This number is called a "frame code". By recording pictures with frame codes, any desired point on a tape can be precisely located with an absolute address in place of the conventional relative address of CTL signals.

Generating and recording the frame codes

This unit generates 6-digit frame codes and inserts them between 17H and 18H of the vertical blankings of video signals. The frame codes are generated from 000000 to 299999, and they correspond to 2 hours 46 minutes* when timed.

The code number returns to 000000 when it exceeds 299999. The video signal on which the frame codes have been inserted can be recorded on a video tape.

Reading the frame codes

To read out the frame codes recorded on a tape, an optional BKU-701 frame code reader is required. By installing the BKU-701 into TYPE IX series VTR (VO-9600/9600P, VP-9000 etc.) or TYPE VII series VTR (VP-7030 etc.), frame codes can be read out and displayed on the time counter.

- The BKU-701 must be installed by authorized service personnel. For installation, consult your Sony dealer.

Video output with character display function

This unit is equipped with a video output which feeds a video signal with the inserted frame codes as well as character data indicating the frame code value and the status of this unit. The frame code being generated and the condition of this unit can be checked on a monitor screen. A picture combined with character data can be recorded when this output is connected to a recorder.

Rack mounting

The supplied rack mount brackets permit this unit to be installed in a 19-inch standard rack.

Starting methods of frame code insertion

The frame code insertion can be started in three ways in accordance with the START TRIGGER switch setting on the front panel.

1. EXTERNAL PULSE

The unit starts the insertion when an external pulse is detected after the START button is pressed.

2. CUE TONE

The unit starts the insertion when a 1-kHz cue tone is detected after the START button is pressed.

3. MANUAL

The unit immediately starts the insertion when the START button is pressed.

Clearing of the frame codes

If the frame codes or VITC (Vertical Interval Time Codes) have been previously inserted between 17H and 18H of the input video signal, these data will be automatically cleared (deleted) when the unit is turned on even though the unit is in the stop mode. When the unit is in the start mode, the previous data will be replaced with the new frame codes.

Preroll recording

To start the desired picture with the desired frame code value, a preroll time can be set in frames between 0 to 9999 when the EXTERNAL PULSE or CUE TONE is selected for the start trigger.

When detecting an external pulse or a cue tone, the unit starts the frame code insertion from the address next to that obtained by subtracting the preroll time (in frames) from the designated start address. The factory-set value of the preroll time is 150 frames (EK MODEL 125 frames).

Example: When the frame code start address is 1000 and the preroll time is 150 frames

When the preroll time setting is changed, the value is maintained even after the power is turned off.

* NTSC: 2 hours 46 minutes
PAL: 3 hours 20 minutes

1-2. CONNECTIONS

Notes on the audio signal connection

- The audio signal connection is required only when a cue signal is used as the trigger. When a cue signal is not used, connect the audio signal directly from the playback unit to the recording unit.
- When the VTR used has phono type audio input/output, connect them to the phono AUDIO IN and AUDIO OUT jacks of the FCG-700.
- On the FCG-700, use the same type connectors for inputting and outputting the audio signal. Note that the signal connected to the XLR 3-pin input is not fed to the phono output, and the signal connected to the phono input is not fed to the XLR 3-pin output.

1-3. FUNCTION OF PARTS (FRONT PANEL)

FRONT PANEL

1 POWER switch

Turns the unit on and off.

2 SUPERIMPOSE switch

Selects character data to be superimposed on the video output signal fed to the VIDEO OUT-2 connector.

F.CODE/STATUS	To superimpose frame codes and the status data of this unit.
F.CODE	To superimpose frame codes.
OFF	To output video signal only.

3 START TRIGGER selector

Selects the trigger to start inserting frame codes.

EXT. PULSE	To start by an external pulse connected to the EXT.PULSE IN connector. (The START button must be pressed in advance.)
CUE TONE	To start by an external 1 kHz cue signal connected to the AUDIO IN connector. (The START button must be pressed in advance.)
MANUAL	To start by pressing the START button.

- Once the START button is pressed, the trigger selection cannot be changed even if this switch is set to the other positions. To change the trigger, first press the STOP button, and then set this switch to the desired position.

4 RESET button

Clears the value on the display to "000000".

5 Display

Normally shows the frame code value from 000000 to 299999. The display will return to "000000" when it exceeds the maximum value.

In Mode 1 or Mode 2 (see 9 MODE SET button), the data of the mode will be displayed.

6 Data set buttons

Normally set the initial number of frame codes to be inserted.

Each push on the buttons advances the displayed digit one by one. When the button is kept depressed, the digit will continuously advance.

In Mode 1 or Mode 2, these buttons are used for changing the settings.

7 START TRIGGER indicator

Lights up when the START button is pressed with the START TRIGGER selector set at EXT.PULSE or CUE TONE, indicating that frame code insertion will be started by an external signal.

8 NO VIDEO indicator

Lights up when no video signal is connected to the VIDEO IN connector. While this indicator is lit, frame code insertion cannot be started by pressing the START button. If the START button is pressed, the START indicator will start blinking.

EC037ST

9 MODE SET button

Sets the display to "1-xxxx" (Mode 1), "2-On" or "2-OFF" (Mode 2) and the normal frame code indication by turns.

- The MODE SET button is operative only when the unit is in the stop mode (the START indicator is not lit).

Mode 1

The preroll time for a preroll recording can be set in frames in this mode. The setting range is between 0000 and 9999 and the factory-set value is 150 frames. The data will be shown on the display in a form as "1-0150" (Mode No. - Frame number for preroll). (EK MODEL 125 FRAMES)

The frame number can be changed with the data set buttons.

Mode 2

When starting frame code insertion with a cue signal, whether or not the cue signal shall be muted at the audio output is determined in this mode. Each push on the right-most data set button turns the muting on and off by turns.

ON: When the START button is pressed, the audio output is muted, and no signal is fed out until a 1-kHz cue signal is detected and then lost. When the cue signal is lost, the muting is released and the signal supplied via the audio input is output as it is. "2-On" will be shown on the display.

OFF: The cue signal is not muted as the signal supplied via the audio input is constantly fed out from the audio output. "2-OFF" will be shown on the display.

10 START button/indicator

To start inserting frame codes, press the button.

When the START TRIGGER switch is set at MANUAL, the indicator lights up and the insertion starts.

When the START TRIGGER switch is set at EXT.PULSE or CUE TONE, the indicator starts blinking to indicate that the unit is waiting for the external trigger signal.

- While the START indicator is lit, the RESET button, data set buttons, MODE SET button and START TRIGGER switch are not operative.

11 STOP button

Stops inserting adding frame codes. When the button is pressed, the START indicator goes off.

1-4. FUNCTION OF PARTS (REAR PANEL)

REAR PANEL

- 1 Ground terminal**
For signals.

- 2 VIDEO IN connector (BNC type)**
Accepts a video signal into which frame codes are to be inserted. This connector is terminated with 75 ohms.

- 3 VIDEO OUT-1 connector (BNC type)**
Outputs a video signal from the VIDEO IN connector after frame codes have been inserted. Connect this output to the video input of a recorder.
• When the unit is turned off, the signal connected to the VIDEO IN connector is output as it is and the 75-ohm termination of the VIDEO IN connector is also turned off.

- 4 VIDEO OUT-2/SUPERIMPOSE connector (BNC type)**
Outputs the same signal as that fed from the VIDEO OUT-1 connector after adding character data (frame code and status data) selected with the SUPERIMPOSE switch. When connected to the video input of a video monitor, the inserted frame codes and the status of this unit can be monitored on the screen. When recording those character data, connect this output to the video input connector of a recorder.

- 5 EXT. PULSE IN (external pulse input) connector (BNC type)**
Accepts the trigger signal to start adding frame codes. Frame code insertion will begin when a pulse is detected while the START indicator is lit and the START TRIGGER switch is set at EXT.PULSE.
For the pulse, a TTL low level signal of more than 10 msec. is required.

- 6 AUDIO IN connectors (XLR 3-pin connector and phono jack)**

Accept a cue signal or an audio channel on which a cue signal has been recorded (normally, channel 1 of a VTR) to start frame code insertion with a cue signal.

A recorder with a XLR 3-pin audio output should be connected to the XLR 3-pin input, while a VTR with a phono type audio output should be connected to the phono connector.

For the cue signal, a 1 kHz \pm 100 Hz signal of more than 10 msec. is required.

- The level of the cue signal must be more than +1 dBs when the XLR 3-pin input is used, while it must be less than -3 dBs when the phono type input is used.
- When not using cue signal, an audio signal need not be connected to this unit. Directly connect the audio signal from the playback unit to the recording unit.

- 7 AUDIO OUT connectors (XLR 3-pin connector and phono jack)**

Output an audio signal when an audio signal is supplied to the respective AUDIO IN connectors. The signal connected to the XLR 3-pin type input is fed to the XLR type output and that connected to the phono type input is fed to the phono type output.
Connect the output to the audio channel 1 input of a recorder.

- When the START TRIGGER switch is set to CUE TONE and the setting of Mode 2 is ON, the output signal will be muted with push on the START button until a cue signal is detected within the unit.

- 8 AC IN connector**

Accepts an AC power. Use the supplied AC power cord for the connection.

1-5. OPERATION

1 Press the ON side of the POWER switch to turn on the unit.

2 Select the character data to be displayed on the monitor by setting the SUPERIMPOSE switch to:

OFF	for no character data.
F.CODE	for displaying frame codes.
F.CODE/STATUS	for displaying frame codes and status data.

3 Set the START TRIGGER selector to:

MANUAL	to start the frame code insertion by pressing the START button.
CUE TONE	to start the frame code insertion by an external cue signal.
EXT.PULSE	to start the frame code insertion by an external pulse.

4 Set the initial frame code number with the data set buttons.

5 Play a tape on the VTR.

6 Press the START button.

When the START TRIGGER switch has been set to MANUAL in step 3, the START indicator lights up and the frame code insertion begins.

When the START TRIGGER selector has been set to CUE TONE or EXT.PULSE in step 3, the START indicator starts blinking. Supply a cue signal or a pulse to start the insertion.

To stop the insertion
Press the STOP button.

If the NO VIDEO indicator lights up
No video signal is available at the VIDEO IN connector.
Check the connection.

Notes on the frame code insertion

When the unit is turned on, any data of 17H and 18H of the vertical blankings of the input video signal will be automatically cleared (deleted) even when the unit is in the stop mode. Therefore, if recorded at 17H and 18H, VITC (Vertical Interval Time Code) data cannot be used after the frame code insertion.

CUE SIGNAL MUTING

When a cue signal recorded on the audio channel of a tape is used as a trigger, it can be muted at the audio output,

- 1 Press the MODE SET button twice to select Mode 2.

- 2 Each push on the right-most data set button turns the muting on and off by turns.
On: The cue signal is muted.
OFF: The cue signal is not muted.
- 3 Press the MODE SET button again to release Mode 2.

PREROLL TIME SETTING

By setting a preroll time by picture frame, you can start inserting frame codes a predetermined time before the desired point. Perform the setting while the unit is in the stop mode (the START indicator is not lit).

- 1 Press the MODE SET button.

- 2 Press the data set buttons to set the desired preroll time in frames.
- 3 Press the MODE SET button twice to release the Mode set condition.

EXAMPLE OF FRAME CODE INSERTION

Initial frame code: 001000

Preroll: 90 frames

Trigger for starting: Cue signal recorded on an audio channel

Cue signal to the audio output: Muted

1 Record a cue signal on audio channel 1 of the video tape in which frame codes are to be inserted.

2 Set the frame number for preroll in Mode 1.

- 1) Press the MODE SET button.
- 2) Press the data set buttons to set the number.

3 Mute the cue signal to the audio output in Mode 2.

- 1) Press the MODE SET button.
- 2) Press one of the data set buttons so that "2-On" is shown on the display.

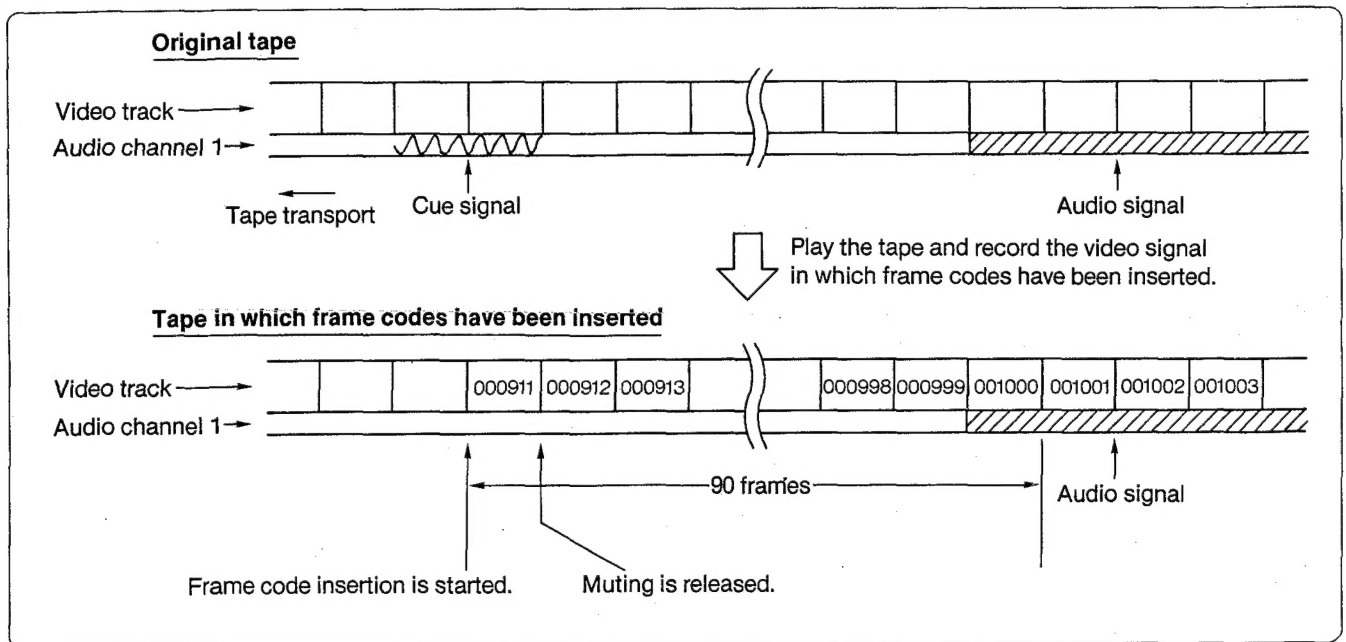

4 Press the MODE SET button to release the Mode set condition.

5 Set the initial frame code to be inserted.

Then, play the tape prepared in Step 1 and record it on another tape while inserting frame codes.

CHAPTER 2 SERVICE INFORMATION

2-1. CABINET REMOVAL

FCG-700

2-2. RACK MOUNTING

The FCG-700 is designed to be mounted in a 19-inch EIA standard rack.

- ① Secure the brackets to FCG-700 with the four screws supplied.
- ② Remove the four feet from the bottom.
- ③ Secure the unit on the rack with the four screws and washers supplied.

- All resistors are in Ω and 1/6W unless otherwise specified.
- : panel designation.

CHAPTER 6 ADJUSTMENTS

6-1. PREPARATION

1. A way of connecting.

- Connect a video signal generator to the video in jack.
- Connect a 75 Ω load to the video out-1 jack.
- Connect a monitor TV to the video out-2 jack.
- Connect a 75 Ω load to the monitor TV.

AC INPUT J 100V 50/60Hz
UC 120V 50/60Hz
EK 220/240V 50/60Hz

6-2. SET THE MODE

1. Turn on the power of FCG-700 and Push the MODE SET switch of the front panel.
2. Push the SET switch to express 1-
U/C-0150 EK-0125
3. Press the MODE SET switch again and the SET switch at the end of right to express 2- .
4. Press the MODE SET switch again and make sure of the expression of .
5. Turn on/off the power and press the MODE SET switch. In this time, make sure that the number setted in the step 2 is expressed.
6. Press the MODE SET switch again and make sure that 2- is expressed.

2. Set the switch of the CPU board.

- S102 U/C NTSC side
EK PAL side
- S103 S103-1 and S103-2 are OFF.

3. DC voltage check.

- Measure the voltage between TP101 and TP102.
Specification 5 \pm 0.15 V
- Measure the voltage between the cathode of D119 and TP102.
Specification -5 \pm 0.2 V

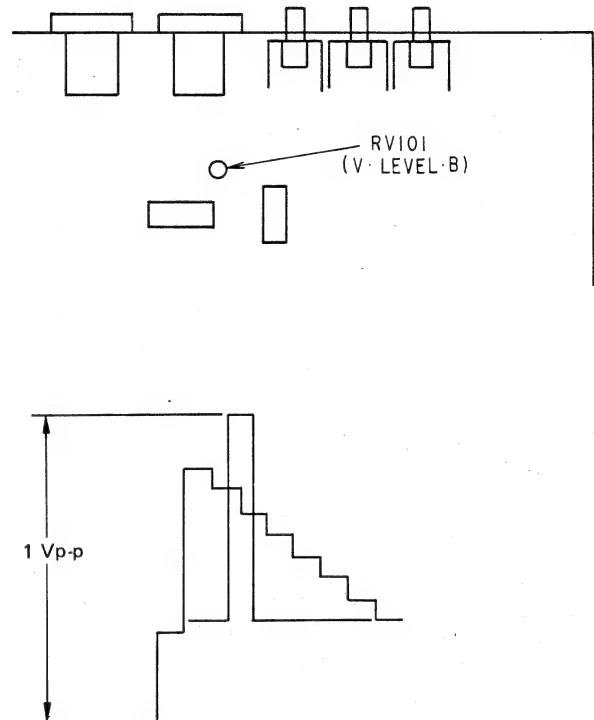

6-3. VIDEO OUT-1 OUTPUT LEVEL ADJUSTMENT

1. Input the EIA COLOR BAR signal and make sure Input level 1 Vp-p
2. Put 75 Ω load on the output of VIDEO OUT-1 and observe the both sides on the oscilloscope.
3. Adjust RV104 so that the output level may be 1 V ± 0.1 p-p at the p-p, watching the oscilloscope.
4. Turn off the power of FCG-700 and make sure that a waveform does not change compared with the waveform adjusted in the step 3.
(When the power is off, the input signal is through out by a relay.)

6-4. VIDEO OUT-2 OUTPUT LEVEL ADJUSTMENT

1. Connect 75 Ω load to the output of the VIDEO OUT-2 and observe the both sides on the oscilloscope.
2. Adjust RV101 so that the output level may be 1 ± 0.1 Vp-p, watching the oscilloscope.

6-5. FRAME CODE LEVEL ADJUSTMENT

1. Connect a monitor TV to VIDEO OUT-2 and set the START TRIGGER switch to MANUAL.
2. Set the SUPER IMPOSE switch to F.CODE and press the START switch. In this time, make sure that the START LED lights.
3. After making sure that the frame code expression of the monitor TV increases, turn off the power.
4. Adjust RV102 so that the level of the frame code may be $80 \text{ IRE} \pm 10 \text{ IRE}$ (when a picture signal is 1 Vp-p, it is $570 \pm 60 \text{ mV}$), watching the oscilloscope.
Make sure of a waveform of the frame code.

6-6. FRAME CODE TIMING ADJUSTMENT

1. Input the full field color bar and press the RESET button to express $\square\square\square\square\square$.
2. Set the START TRIGGER switch to MANUAL and press the START switch.
3. Move the V synchronism of the monitor TV and adjust RV103 so that the third white line may be on the center of border of white and yellow, making sure of the position of the frame code.
Note: Adjust under 19999 frame code.

6-7. CONFIRMATION OF PHONO INPUT/OUTPUT

1. Input the 1 kHz/-8 dBs signal to the AUDIO IN of the PHONO jack and turn off the START TRIGGER.
2. Turn off the power of FCG-700 and measure the AUDIO OUT level of PHONO jack.
Output level -8 dBs (through out by relay)
3. Turn on the power and measure the AUDIO OUT level of the PHONO jack.
Output level -8 dBs
4. Change over to CUE TONE at the START TRIGGER switch, press the START switch, and make sure that the output signal fails.

6-8. CONFIRMATION OF XLR INPUT/OUTPUT

1. Input the 1 kHz/+1 dBs signal to the AUDIO IN of the XLR and turn off the START TRIGGER switch.
2. Turn off the power of FCG-700 and measure level of the XLR AUDIO OUT.
Output level +1 dBs (through out by relay)
3. Turn on the power and measure the level of the XLR AUDIO OUT.
Output level +1 dBs
4. Change over to CUE TONE at the START TRIGGER switch, press the START switch, and make sure that the output signal fails.

Items marked " * " are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.

The components identified by shading and mark A are critical for safety. Replace only with part number specified.

Les composants identifiés par une trame et une marque A sont critiques pour la sécurité. Ne les remplacer que par une pièce portant le numéro spécifié.
